

Login Product App

2. Create a Simple Console-Based Login + Product List Application

Fields

a. Email

- Validate whether the email format is correct

Example valid format:

abc@gmail.com

b. Password

- Password must contain at least 6 characters

Solution:

The email address is validated to ensure it follows a proper format (e.g., abc@gmail.com). The password is validated to ensure it contains at least 6 characters. If both validations are successful, the user is logged in and a list of available products is displayed. Otherwise, appropriate error messages are shown.

Java Coding :

```
import java.util.Scanner; public class LoginProductApp {
public static void main(String[] args) { Scanner sc = new Scanner(System.in);
System.out.print("Enter Email: ");

String email = sc.nextLine();
System.out.print("Enter Password: ");
String password = sc.nextLine();
// Email Validation
String emailPattern = "[A-Za-z0-9+_.-]+@gmail\\.com$"; if (!email.matches(emailPattern)) {
System.out.println("Invalid Email Format!");
return; }
// Password Validation
if (password.length() < 6) {
System.out.println("Password must contain at least 6 characters!");
return; }
System.out.println("\nLogin Successful!"); // Product List System.out.println("\nAvailable
Products:"); System.out.println("1. Pen - Rs.20"); System.out.println("2. Book - Rs.50");
System.out.println("3. Notebook - Rs.80"); sc.close();
}}
```

Input :

Enter Email: abc@gmail.com

Enter Password: abc123

Output :

Login Successful! Available Products: 1. Pen - Rs.20

2. Book - Rs.50

3. Notebook - Rs.80
